

The revolution in the digitalisation of buildings and facilities

FRAMENCE creates a photorealistic hybrid model of your buildings and facilities. All you have to do is take panoramic photos – the **FRAMENCE** software will do the rest.

You can combine the hybrid model with existing 2D plans, 3D models and even manage all your assets.

FRAMENCE in a Nutshell

Create a photorealistic digital twin with photos, not point clouds.

Work with panoramas that act like real 3D models, thanks to intelligent software procedures and AI.

No need for cost-intensive hardware or specifically trained staff for capturing panoramas.

Obtain real measurements and 3D information from the hybrid model.

Create 3D objects at any time.

Combine different graphic methods and integrate existing 2D plans and 3D models.

Integrate drone pictures and detailed photos.

Use the integrated asset management system for documenting your vital assets.

BUILT-IN ASSET MANAGEMENT

Document asset information in the photorealistic environment by using the built-in asset management system. Existing databases such as CAFM or ERP may be linked.

MONITOR THE CONSTRUCTION PROGRESS

By superimposing the panorama on the building plans, the construction process can be monitored closely – even when you are not at site. You can even “go back” in time and check on the progress by using the time machine. Also pictures can be automatically monitored for any changes.

 **FRAMENCE**

JUST LIKE A 3D MODEL

Thanks to the intelligent IT methods used in FRAMENCE, the panoramas act like a 3D model – with a simple click, you can, for example, take measurements directly from the photo.

We provide the technologies

FRAMENCE is an SaaS solution and split into 3 modules that differ in function in order to meet your specific requirements.

FRAMENCE® Viewer

FRAMENCE Viewer is the standard module for viewing the **hybrid model** in your browser and for taking **real measurements** in the panoramas. You can also access and edit asset information.

FRAMENCE® Editor

The admin module Editor contains all Viewer functions. You can **create** and **configure new assets** in the data base and save necessary attributes. Moreover, you can turn photos into **3D objects** and define **3D nets**.

FRAMENCE® Creator

FRAMENCE Creator is the master module that contains all Editor functions. You can **import panoramas**, **create the hybrid model** out of simple photos and add **CAD plans**, **BIM data** and **BIM models** as well.

Become a Partner

The FRAMENCE corporate concept is to be a developer and provider of basic technologies for creating and processing image-based hybrid graphics.

Expand your business model with an efficient and progressive technology. If you document buildings and facilities for your clients, you can add photorealistic digital twins to your portfolio and capture technical data. While laser scanning requires expensive hardware and a lot of expertise, you can jump start with FRAMENCE straight away.

We have already attained several companies as clients and many more have expressed their interest in our solutions. In order to continuously grow our company and to introduce our method on an international level, we welcome investors who would like to share in our scalable business model.

Help us spread this new method and add significant value to your business. We can help you get started.
